

CSA15- CLOUD COMPUTING AND BIG DATA ANALYTICS

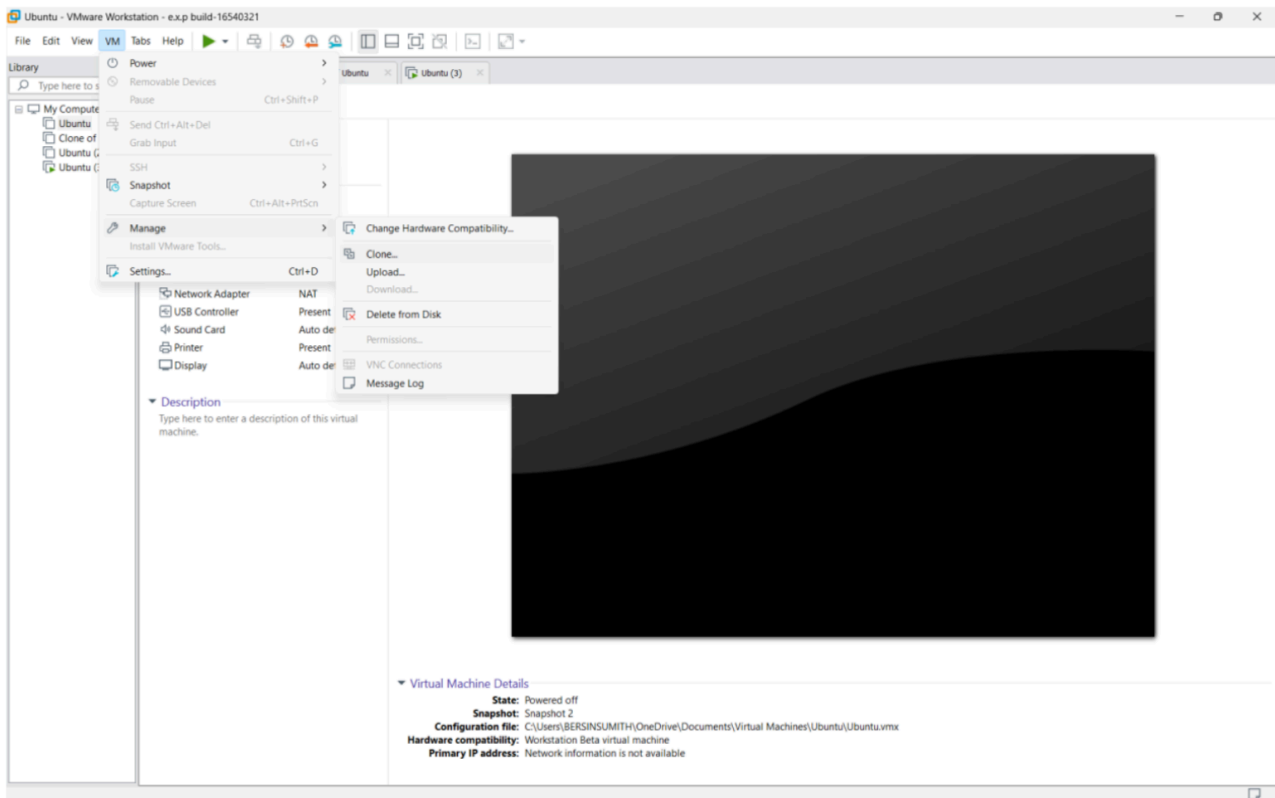

Aim:

To create a **clone of an existing Virtual Machine (VM)** and verify the cloned VM by loading and running the previous version/cloned copy successfully.

Procedure:

1. Open the virtualization software such as **VMware Workstation/ Fusion**.
2. Select the existing Virtual Machine that needs to be cloned.
3. Make sure the original VM is **powered off**.
4. Right-click the VM and select **Clone**.
5. Choose the option to create a **full clone**.
6. Give the cloned VM a suitable name and select the storage location.
7. Start the cloning process and wait until it is completed.
8. After cloning is complete, the new VM will appear separately from the original VM.
9. Power on the cloned VM.
10. Check whether the operating system loads correctly.
11. Verify that the files, applications, and settings from the original VM are available in the cloned VM.
12. Make a small test change in the cloned VM and restart it to confirm that it works independently.
13. Shut down the cloned VM after testing.

OUTPUT

Result

The **Virtual Machine was successfully cloned**, and the cloned VM was loaded and tested successfully. The operating system, files, applications, and settings were retained in the cloned VM, confirming that the cloning process was successful.
