

24-07-2026.

1. Define cloud computing and explain any four characteristics that make it different from traditional on premise computing.

→ cloud computing is the Delivery of an computing Such as servers, storages, data bases, networking, software, and analytics over the internet.

→ characteristics of cloud computing.

* Resource pooling - cloud providers pool computing resources to serve multiple users.

* Using a shared infrastructure, improving efficiency.

* Elasticity and Scalability :- Resources can be increased or decreased automatically based on user demand making cloud services flexible.

* Measured services - cloud usage in the monitoring and billed based on actual consumption.

2. Ans:

cloud computing evolved through the several stages of technologies of development.

- * Hardware . Evaluation
- * ~~High Demand~~ . Modern cloud platforms
- * Distributive Systems.
- * Internet software ~~systems~~ evaluation

3.

Role of Server Virtualization is the process of creating multiple Virtual ~~box~~ Machines (VM) on a single physical server using a hypervisor.

- Improves Resource Utilization
- Reduces cost.
- Provided scalability
- Enhances Flexibility
- Enables cloud computing

- 5.
- * IaaS - Infrastructure as a services
 - * PaaS - platform as a services
 - * SaaS - Software as a services
 - * XaaS - Anything as a services.

* IaaS - Infrastructure as a services.

→ AWS, Microsoft, Azure VM.
Google. computer engine. This is the
real world example of IaaS.

* PaaS - Platform as a services.

→ Google app Engine, Azure app
services. This is real world application

* SaaS - Software as a services.

→ Gmail, Microsoft 365, zoom.

* XaaS - Anything as a services

→ storage as a services and.
This is the Dropbox. and Amazon.
RDS. and cloud flare.
